

Title

Budget impact of pacing and energy conservation coaching for post-viral fatigue syndrome: a follow-up analysis of care pathways

Abstract

A within-trial economic evaluation estimated healthcare use and costs associated with pacing and energy conservation coaching for post-viral fatigue syndrome. Resource use, service contacts, medication changes, and quality-adjusted survival were compared with standard care. Results were sensitive to assumptions about intervention delivery and longer-term maintenance. Costs were separated into intervention delivery, primary care, hospital care, and medication use. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
