

Title

Patient-reported experience after pacing and energy conservation coaching for post-viral fatigue syndrome: an analysis of treatment persistence

Abstract

This report examined patient-reported experience and quality of life after pacing and energy conservation coaching for post-viral fatigue syndrome. Participants described changes in daily activity, confidence, symptom control, and care burden. Improvements in physical function were accompanied by variable satisfaction with access and treatment workload. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. The authors described uncertainty around maintenance of the observed pattern beyond follow-up. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
