

Title

A pragmatic evaluation of pacing and energy conservation coaching for post-viral fatigue syndrome: a report from regional services

Abstract

The trial team compared pacing and energy conservation coaching against standard care in 470 adults with post-viral fatigue syndrome. The intervention showed a small but measurable benefit for physical function, while treatment exposure and adverse events were broadly comparable between groups. Generalisability may be reduced because participating sites had established research infrastructure. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
