

Title

Randomized trial of pacing and energy conservation coaching for post-viral fatigue syndrome: an assessment of variation in response

Abstract

The trial team compared pacing and energy conservation coaching against standard care in 470 adults with post-viral fatigue syndrome. The intervention showed a small but measurable benefit for physical function, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. Results were interpreted alongside baseline severity, treatment exposure, and concurrent care. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
