

Title

Methods Paper Describing The Trial Framework for home blood pressure monitoring in hypertension: a longitudinal safety analysis

Abstract

the trial team compared home blood pressure monitoring for adults with hypertension. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 87 and glycaemic control is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Generalisability may be reduced because participating sites had established research infrastructure. Service capacity and local referral practices influenced the observed pattern of care. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
