

Title

Primary results from home blood pressure monitoring for hypertension: a study of implementation fidelity

Abstract

Researchers evaluated home blood pressure monitoring against standard care in 87 adults with hypertension. The observed difference was clinically interpretable for glycaemic control, while treatment exposure and adverse events were broadly comparable between groups. The findings should be considered alongside short follow-up and incomplete adherence data. The analysis was designed to reflect the decisions faced by clinicians in routine practice. This report is from a parallel-group randomized controlled trial comparing Control: routine care vs Intervention: inhaled anti-inflammatory therapy + pharmacist medication review.
