

Title

Protocol And Statistical Analysis Plan for a graded activity programme in chronic low back pain: an analysis of resource use

Abstract

the trial team compared a graded activity programme for adults with chronic low back pain. Participants will be recruited through primary-care and specialist clinics; the planned sample is 161 and pain-related function is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. The report distinguishes protocol-defined outcomes from exploratory measures collected during follow-up. This report is from a parallel-group randomized controlled trial comparing Control: placebo education vs Intervention: telemonitoring coaching + dietary counselling.
