

Title

Comparative effectiveness of structured medication review for heart failure with preserved ejection fraction: an analysis of longer-term use

Abstract

An outpatient research network tested structured medication review against standard care in 198 adults with heart failure with preserved ejection fraction. The intervention showed a small but measurable benefit for symptom burden, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. Results were broadly stable after adjustment for age, baseline severity, and prior treatment. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: dietary counselling + mindfulness sessions.
