

Title

Design And Implementation Protocol for brief sleep restriction therapy in insomnia in older adults: a pragmatic service evaluation

Abstract

a multicentre investigation examined brief sleep restriction therapy for adults with insomnia in older adults. Participants will be recruited through primary-care and specialist clinics; the planned sample is 346 and sleep efficiency is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. Interpretation is limited by attrition and the pragmatic delivery setting. Recruitment pathways and treatment fidelity were examined to support interpretation of the estimates. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
