

## Title

Outcomes following brief sleep restriction therapy for insomnia in older adults: findings from routine clinical practice

## Abstract

Researchers evaluated brief sleep restriction therapy against standard care in 346 adults with insomnia in older adults. The primary analysis indicated a modest improvement for sleep efficiency, while treatment exposure and adverse events were broadly comparable between groups. Interpretation is limited by attrition and the pragmatic delivery setting. The report includes a sensitivity analysis using an alternative definition of the primary outcome. This report is from a parallel-group randomized controlled trial comparing Control: wait-list care vs Intervention: strength and balance exercise + inhaled anti-inflammatory therapy.
