

Title

Design And Implementation Protocol for home blood pressure monitoring in hypertension: a patient-centred outcomes report, report 247

Abstract

investigators explored home blood pressure monitoring for adults with hypertension. Participants will be recruited within a pragmatic network of hospital and community providers; the planned sample is 420 and glycaemic control is the principal endpoint. The protocol prespecifies safety, adherence, and quality-of-life measures and describes procedures for missing observations. The study was not powered to detect uncommon adverse events. Service capacity and local referral practices influenced the observed pattern of care. This report is from a parallel-group randomized controlled trial comparing Control: usual care vs Intervention: pharmacist medication review + telemonitoring coaching.
