

Title

Corrigendum: Twenty-Four-Hour Intraocular Pressure Response to Sepetaprost Compared With Latanoprost

Abstract

In the above-titled article (published this year), the baseline demographic table incorrectly listed the mean age of the latanoprost group as 58–12 years; the correct value is 61–14 years. This correction does not affect the reported efficacy or safety analyses, as randomization ensured group balance, and age was included as a covariate in all statistical models. The conclusions regarding intraocular pressure reduction and adverse event profiles remain unchanged.
