

Title

Retraction: Pathophysiology-Guided Therapy and Patient Perceptions of Illness in Angina Without Coronary Obstruction: Twelve-Month Findings

Abstract

This article is retracted due to data irregularities identified during post-publication verification review. Discrepancies between source data and submitted case report forms for approximately 18% of randomized participants have been documented. The study authors were unable to reconcile these discrepancies or provide original source documentation upon request. While the directions of observed treatment effects remain consistent with mechanistic expectations, the integrity of the quantitative findings cannot be assured. We apologize to the scientific community for this development.
