

Title

Efficacy of Integrated Digital Care Management in Reducing Pruritis and Improving Clinical Outcomes in Adults With Atopic Dermatitis

Abstract

Itch represents the cardinal symptom driving disability in atopic dermatitis, yet conventional episodic care often inadequately addresses this burden. We randomly assigned 98 participants (mean age 42 years, 45% female) to receive either integrated online care coordination (n=49) or standard care (n=49). At 12-week assessment, the coordinated-care group demonstrated clinically meaningful reductions in itch severity compared with controls (mean difference 2.9 points on 10-point scale, $p<0.001$). Disease severity scores measuring extent and intensity of skin involvement improved significantly in the intervention arm ($p<0.001$). Sleep quality measurements showed greater improvement in the online-care group (mean difference 1.8 points, $p=0.03$). Dermatitis-related quality-of-life scores increased substantially in the intervention group ($p<0.001$). No serious adverse events were documented. Participant satisfaction with care delivery was high in both groups, though the online-care participants reported preferring the coordinated approach for future management.
