

Title

Retraction notice: Safety, tolerability, and lipid response after short-term administration of TLC-2716 in humans

Abstract

The authors have requested retraction of their phase 1 results article due to data irregularities discovered during an audit of source records. Specifically, baseline lipid measurements for three enrolled subjects could not be reconciled with laboratory documentation. While the overall tolerability profile remains consistent with the published summary, the integrity of the lipid response dataset cannot be definitively established. The authors were unable to provide complete source data upon request. The study will require replication with enhanced data governance procedures.
